ABSTRACT: The objective of the present study, we discuss the heat and mass transfer on MHD unsteady visco-elastic second order Rivlin-Erickson fluid past an impulsively started infinite vertical plate in the presence of a foreign mass and constant mass flux on taking into account of viscous dissipative heat at the plate under the influence of a uniform transverse magnetic field in the presence of chemical reaction. The flow is governed by a coupled non-linear system of partial differential equations. These equations are solved by using perturbation technique. The velocity, temperature, concentration, skin - friction and the rate of heat transfer are derived. The results are graphically discussed for various values of physical parameters.

Keywords: Chemical reaction, Rivlin - Erickson Fluid, Mass Transfer, heat source, Porous medium, MHD Viscous Flow, mass flux

I. INTRODUCTION

In recent years, a great deal of interest has been generated in the area of heat and mass transfer of the boundary layer flow over a stretching sheet, in view of its numerous and wide-ranging applications in various fields like polymer processing industry in particular in manufacturing process of artificial film and artificial fibers and in some applications of dilute polymer solution. Heat and mass transfer in wet porous media are coupled in a complicated way. The structure of the solid matrix varies widely in shape. There is, in general, a distribution of void sizes, and the structures may also be locally irregular. Energy transport in such a medium occurs by conduction in all of the phases. Mass transport occurs within voids of the medium. In an unsaturated state these voids are partially filled with a liquid, whereas the rest of the voids contain some gas.

It is a common misapprehension that nonhygroscopic fibers (i.e., those of low intrinsic for moisture vapor) will automatically produce a hydrophobic fabric. The major significance of the fine geometry of a textile structure in contributing to resistance to water penetration can be stated in the following manner.

In recent years, a great deal of interest has been generated in the area of heat and mass transfer of the boundary layer flow over a stretching sheet, in view of its numerous and wide-ranging applications in various fields like polymer processing industry in particular in manufacturing process of artificial film and artificial fibers and in some applications of dilute polymer solution. Engineering processes in which a fluid supports an exothermal chemical or nuclear reaction are very common today and the correct process design requires accurate correlation for the heat transfer coefficients at the boundary surfaces. Despite its increasing importance in technological and physical problems, the unsteady MHD free convection flows of dissipative fluids past an infinite plate have received much attention because of non-linearity of the governing equations. Saravana et.al [20] Mass Transfer effects on MHD Viscous flow past an impulsively started infinite vertical plate with constant mass flux. The effect of the presence of impurities is studied in scientific literature by considering it as a foreign mass. It is usually a very complicated phenomenon; however, by introducing suitable assumptions, the governing equations can be simplified. Rajput and Kumar [12] Radiation effects on MHD flow past an impulsively started vertical plate with variable heat and mass transfer.

In view of increasing importance of non-Newtonian flows, a great deal of work has been carried out to find the similarity solution of viscoelastic fluid flow over impervious stretching boundary. Rajagopal et al. [21] examined for a special class of visco-elastic fluids known as second order fluids. Siddappa et al. [22] studied the flow of viscoelastic fluids of the type Walter’s liquid B past a stretching sheet. Abel and Veena [23] studied the visco -elasticity on the flow and heat transfer in a porous medium over a stretching sheet. All these studies deals with the studies concerning non-Newtonian flows and heat transfer in the absence of magnetic fields, but present years we find several industrial
applications such as polymer technology and metallurgy where the magnetic field is applied in the visco-elastic fluid flow. Sarpakaya [25] was mostly first researcher to investigate MHD flows of non-Newtonian fluids. Andersson [26] investigated the flow problem of electrically conducting viscoelastic fluid past a flat and impermeable elastic sheet and later his work is extended by many authors Abel, et.al; Abel et.al ; Seddeek and Prasad et.al [27, 28, 29, 5]. Abel and Mahesha [30] Heat Transfer in MHD Viscoelastic Fluid Flow over a Stretching Sheet with Variable Thermal Conductivity, Non-Uniform Heat Source and Radiation.

Chemical reactions usually accompany a large amount of exothermic and endothermic reactions. These characteristics can be easily seen in a lot of industrial processes. Recently, it has been realized that it is not always permissible to neglect the convection effects in porous constructed chemical reactors. The reaction produced in a porous medium was extraordinarily in common, such as the topic of PEM fuel cells modules and the polluted underground water because of discharging the toxic substance, etc. Muthucumaraswamy and Ganesan [11] studied effect of the chemical reaction and injection on flow characteristics in an unsteady upward motion of an isothermal plate. Deka et al. [3] studied the effect of the first order homogeneous chemical reaction on the process of an unsteady flow past an infinite vertical plate with a constant heat and mass transfer. Chamkha [1] assumed that the plate is embedded in a uniform porous medium and moves with a constant velocity in the flow direction in the presence of a transverse magnetic field. Kesavaiah et.al [9] effects of the chemical reaction and radiation absorption on an unsteady MHD convective heat and mass transfer flow past a semi-infinite vertical permeable moving plate embedded in a porous medium with heat source and suction. Modather et.al [10] An analytical study of MHD heat and mass transfer oscillatory flow of a micropolar fluid over a vertical permeable plate in a porous medium. Kandasamy et al. [8] studied the nonlinear MHD flow, with heat and mass transfer characteristics, of an incompressible, viscous, electrically conducting, Boussinesq fluid on a vertical stretching surface with chemical reaction and thermal stratification effects. Devika et.al [31] MHD oscillatory flow of a visco elastic fluid in a porous channel with chemical reaction.

Study of MHD flow with heat and mass transfer plays an important role in biological Sciences. Effects of various parameters on human body can be studied and appropriate suggestions can be given to the persons working in hazardous areas having noticeable effects of magnetism and heat variation. Study of MHD flows also has many other important technological and geothermal applications. Some important applications are cooling of nuclear reactors, liquid metals fluid, power generation system and aero dynamics. The effects of radiation on free convection on the accelerated flow of a viscous incompressible fluid past an infinite vertical porous plate with suction has many important technological applications in the astrophysical, geophysical and engineering problem. Vajravelu and Sastri [18]. Gupta et al. [6] have analyzed free convection effects on the flow past an accelerated vertical plate in an incompressible dissipative fluid. Mass transfer effects on the flow past an exponentially accelerated vertical plate with constant heat flux was studied by Jha et al [7]. Das et al. [2] have studied effects of mass transfer on flow past an impulsively started vertical infinite plate with constant heat flux and chemical reaction. Ezzat Magdy [4] have considered magneto hydrodynamic unsteady flow of non-Newtonian fluid past an infinite porous plate. Takhar et al.[17] have studied radiation effects on MHD free convection flow of a radiating gas past a semi-infinite vertical plate. Non - Darcy convective boundary layer flow past a semi-infinite vertical plate in saturated porous media was studied by Takhar and Beg [16]. Saleh Alharbi et.al [19] Heat and mass transfer in MHD Visco-Elastic fluid flow through a porous medium over a stretching sheet with chemical reaction.

The objective of the present paper is to analyze the heat and mass transfer effects on MHD visco elastic fluid flow past an impulsively started infinite vertical plate with constant mass flux, on taking into account of viscous dissipative heat under the influence of a uniform transverse magnetic field with heat source in the presence of chemical reaction.

II. FORMULATION OF THE PROBLEM
Consider the flow of a viscous incompressible visco-elastic second order Rivlin-Erickson fluid past an impulsively started infinite vertical plate with heat source in the presence of chemical reaction taking into an account. The \( x' \) – axis is taken along the plate in the vertically upward direction and the \( y' \)- axis is chosen normal to the plate. Initially the temperature of the plate and the fluid \( T_{w} \), and the species concentration at the plate \( C_{w} \) and in the fluid throughout
$C'$ are assumed to be the same. At time $t' > 0$, the plate temperature is changed to $T_w'$ causing convection currents to flow near the plate and mass is supplied at a constant rate to the plate and the plate starts moving upward due to impulsive motion, gaining a velocity of $U_0$. A uniform magnetic field of intensity $H_0$ is applied in the y-direction. Therefore the velocity and the magnetic field are given by $q = (u, 0, 0)$ and $H = (0, H_0, 0)$. The flow being slightly conducting the magnetic Reynolds number is much less than unity and hence the induced magnetic field can be neglected in comparison with the applied magnetic field (Sparrow and Cess [22]) in the absence of any input electric field, the flow is governed by the following equations:

$$\frac{\partial u'}{\partial t'} = g \beta (T' - T_\infty') + g \beta' (C' - C_\infty') + \nu \frac{\partial^2 u'}{\partial y'^2} + K_0^* \left( \frac{\partial^3 u'}{\partial y'^3 \partial t'} \right) - \frac{\nu}{K'} u' - \frac{\sigma \mu^2 H_0^2}{\rho} u'$$  \hspace{1cm} (1)

$$\rho C_p \frac{\partial T'}{\partial t'} = K \frac{\partial^2 T'}{\partial y'^2} + \mu \left( \frac{\partial u'}{\partial y'} \right)^2 - Q_0 (T' - T_\infty')$$ \hspace{1cm} (2)

$$\frac{\partial C'}{\partial t'} = D \frac{\partial^2 C'}{\partial y'^2} - K r' (C' - C_\infty')$$ \hspace{1cm} (3)

The initial and boundary conditions for the velocity, temperature and concentration fields are

$$u' = 0, T' = T_w', C' = C_\infty'; \text{for all} \ y' t' > 0$$

$$u' = U_0, T' \rightarrow T_w', \frac{dC'}{dy'} = -\frac{j''}{D}; \text{at} \ y' = 0$$

$$u' = 0, T' \rightarrow T_w', C' \rightarrow C_\infty'; \text{as} \ y \rightarrow \infty$$ \hspace{1cm} (4)

Where $u'$ is the velocity of the fluid along the plate in the $x'$-direction, $t'$ is the time, $g$ is the acceleration due to gravity, $\beta$ is the coefficient of volume expansion, $\beta'$ is the coefficient of thermal expansion with concentration, $T_w'$ is the temperature of the fluid near the plate, $T'_w$ is the temperature of the fluid far away from the plate, $T_\infty'$ is the temperature of the fluid, $C'$ is the species concentration in the fluid near the plate, $C_\infty'$ is the species concentration in the fluid far away from the plate, $j''$ is the mass flux per unit area at the plate, $\nu$ is the kinematic viscosity, $K_0^*$ is the coefficient of kinematic visco-elastic parameter, $\sigma$ is the electrical conductivity of the fluid, $\mu$ is the magnetic permeability, $H_0$ is the strength of applied magnetic field, $\rho$ is the density of the fluid, $C_p$ is the specific heat at constant pressure, $K$ is the thermal conductivity of the fluid, $\mu$ is the viscosity of the fluid, $D$ is the molecular diffusivity, $U_0$ is the velocity of the plate.

Equations (1) - (3) can be made dimensionless by introducing the following dimensionless variables and parameters:

In order to write the governing equations and the boundary conditions in dimensionless from, the following non-dimensional quantities are introduced.

$$u = \frac{u'}{U_0}, y = \frac{U_0 y'}{\nu}, t = \frac{t U_0^2}{\nu}, \theta = \frac{T' - T_\infty'}{T'_w - T_\infty'}, C = \frac{C' - C_\infty'}{C'_w - C_\infty'}, K_r = \frac{K r' v}{U_0^2}, Pr = \frac{\nu C_p}{K}, Gr = \frac{\nu^2 g (T'_w - T_\infty')}{U_0^3}, Sc = \frac{\nu}{D}$$

$$G_c = \frac{\nu^2 g j''^2}{U_0^3}, M = \frac{\sigma \mu^2 H_0^2 v}{\rho U_0^2}, \phi = \frac{v Q_0}{\rho C_p U_0^2}, \lambda = \frac{K^* U_0^2 v}{\nu^2},$$

(5)
where $Gr$ is the thermal Grashof number, $Gc$ is modified Grashof Number, $Pr$ is Prandtl Number, $M$ is the magnetic field, $Sc$ is Schmidt number, $Kr$ is Chemical Reaction, $K$ is Porous Permeability, $\phi$ is Heat source parameter respectively.

In terms of the above dimensionless quantities, Equations (1) – (2) reduces to

$$\frac{\partial u}{\partial t} = Gr \theta + Gc C + \frac{\partial^2 u}{\partial y^2} + \lambda \left( \frac{\partial^2 u}{\partial y^2 \partial t} \right) - \left( M + \frac{1}{K} \right) u$$

(6)

$$\frac{\partial \theta}{\partial t} = \frac{1}{Pr} \frac{\partial^2 \theta}{\partial y^2} + Ec \left( \frac{\partial u}{\partial y} \right)^2 - \phi \theta$$

(7)

$$\frac{\partial C}{\partial t} = \frac{1}{Sc} \frac{\partial^2 C}{\partial y^2} - Kr C$$

(8)

The corresponding boundary conditions are

$$u = 0, \theta = 0, C = 0 \quad for \ all \ y, t \leq 0$$

$$u = 1, \theta = 1, \frac{dC}{dy} = -1 \quad at \ y = 0$$

$$U = 0, \theta \rightarrow 0, C \rightarrow 0 \quad as \ y \rightarrow \infty$$

**III. SOLUTION OF THE PROBLEM**

Equation (6) – (8) are coupled, non–linear partial differential equations and these cannot be solved in closed–form using the initial and boundary conditions (9). However, these equations can be reduced to a set of ordinary differential equations, which can be solved analytically. This can be done by representing the velocity, temperature and concentration of the fluid in the neighbourhood of the fluid in the neighbourhood of the plate as

$$u = u_0(y) + \varepsilon u''_0(y) + 0(\varepsilon^2)$$

$$\theta = \theta_0(y) + \varepsilon \theta''_0(y) + 0(\varepsilon^2)$$

$$C = C_0(y) + \varepsilon C''_0(y) + 0(\varepsilon^2)$$

(10)

Substituting (10) in Equation (6) – (8) and equating the harmonic and non–harmonic terms, and neglecting the higher order terms of $0(\varepsilon^2)$, we obtain

$$u''_0 - N_1 u_0 = -Gr \theta_0 - Gc C_0$$

(11)

$$N_2 u''_0 + N_1 u'_0 - N_1 u_0 = -Gr \theta'_0 - Gc C'_0$$

(12)

$$\theta''_0 - Pr \phi \theta_0 = -Pr Ec u''_0$$

(13)

$$\theta''_0 - \beta_2 \theta'_0 = -2 Pr Ec u'_0 u'_1$$

(14)

$$C''_0 - Sc Kr C_0 = 0$$

(15)

$$C'_0 - \beta_1 C'_1 = 0$$

(16)

The corresponding boundary conditions can be written as
The Equations (11) - (16) are still coupled and non-linear, whose exact solutions are not possible. So we expand $u_0, u_1, \theta_0, \theta_1, C_0, C_1$ in terms of $Ec$ in the following form, as the Eckert number is very small for incompressible flows.

\[
f_0(y) = f_{01}(y) + Ec \ f_{02}(y)
\]

\[
f_1(y) = f_{11}(y) + Ec \ f_{12}(y)
\]

(18)

Substituting (18) in Equations (11) - (16), equating the coefficients of $Ec$ to zero and neglecting the terms in $Ec^2$ and higher order, we get the following equations.

\[
u_{01}^* - N_1 u_{01} = -Gr \theta_{01} - Gc \ C_{01}
\]

(19)

\[
u_{02}^* - N_1 u_{02} = -Gr \theta_{02} - Gc \ C_{02}
\]

(20)

\[N_1 u_{11}^* + Nu_{11}' - N_1 u_{11} = -Gr \ \theta_{11} - Gc \ C_{11}
\]

(21)

\[N_1 u_{12}^* + Nu_{12}' - N_1 u_{12} = -Gr \ \theta_{12} - Gc \ C_{12}
\]

(22)

\[
\theta_{01}^* - Pr \phi \theta_{01} = 0
\]

(23)

\[
\theta_{02}^* - Pr \phi \theta_{02} = -Pr u_{01}'^2
\]

(24)

\[
\theta_{11}' - \beta \ \theta_{11} = 0
\]

(25)

\[
\theta_{12}' - Pr \phi \theta_{12} = -2Pr u_{01}' u_{11}'
\]

(26)

\[C_{01}^* - Sc Kr \ C_{01} = 0
\]

(27)

\[C_{02}^* - Sc Kr \ C_{02} = 0
\]

(28)

\[C_{11}' - \beta_1 C_{11} = 0
\]

(29)

\[C_{12}' - \beta_1 C_{12} = 0
\]

(30)

The respective boundary conditions are

\[
u_{01} = 1, \ u_{02} = 0, \ \theta_{01} = 1 \theta_{02} = 0, \ \frac{dC_{01}}{dy} = -1, \ \frac{dC_{02}}{dy} = 0 \quad at \ y = 0
\]

(31)

\[
u_{01} \to 0, \ u_{02} \to 0, \ \theta_{01} \to 0 \theta_{02} \to 0, \ C_{01} \to 0, C_{02} \to 0 \quad at \ y \to \infty
\]

(32)

\[
u_{11} = 0, \ u_{12} = 0, \ \theta_{11} = 0 \theta_{12} = 0, \ \frac{dC_{11}}{dy} = 0, \ \frac{dC_{12}}{dy} = 0 \quad at \ y = 0
\]

(33)

\[
u_{11} \to 0, u_{12} \to 0, \ \theta_{11} \to 0 \theta_{12} \to 0, C_{11} \to 0, C_{12} \to 0 \quad as \ y \to \infty
\]

Solving Equations (19) - (30) under the boundary conditions (31) and (32) we obtain the velocity, temperature and concentration distributions in the boundary layer as
\[
\begin{align*}
\dot{u}(y,t) &= A_1 e^{m_1y} + A_2 e^{m_2y} + A_3 e^{m_3y} + Ec \{ A_{11} e^{m_1y} + A_{12} e^{m_2y} + A_{6} e^{m_6y} + A_7 e^{m_7y} + A_8 e^{(m_8+m_4)y} \\ &\quad + A_9 e^{(m_9+m_5)y} + A_{10} e^{(m_{10}+m_{14})y} \} \\
\dot{\theta}(y,t) &= e^{m_3y} + Ec \{ B_1 e^{2m_1y} + B_2 e^{2m_2y} + B_3 e^{2m_3y} + B_4 e^{(m_4+m_5)y} + B_5 e^{(m_5+m_6)y} + B_6 e^{(m_6+m_7)y} + B_7 e^{m_7y} \} \\
C(y,t) &= D_1 e^{m_1y}
\end{align*}
\]

Skin-friction:

We now calculate Skin-friction from the velocity field. It is given in non-dimensional form as:

\[
\tau = -\left( \frac{du}{dy} \right)_{y=0}, \quad \tau' = -\frac{\tau}{\rho U_0^2}
\]

\[
= m_0 A_1 + m_1 A_2 + m_4 A_3 + Ec \{ m_{11} A_{11} + m_{12} A_{12} + 2m_6 A_6 + 2m_{10} A_7 + (m_{10} + m_{14}) A_8 \\
+ (m_2 + m_{10}) A_9 + (m_2 + m_{14}) A_{10} \}
\]

Rate of heat transfer:

The dimensionless rate of heat transfer is given by

\[
Nu = -\left( \frac{d\theta}{dy} \right)_{y=0}
\]

\[
= m_0 + Ec \{ m_5 B_1 + 2m_4 B_2 + 2m_{10} B_3 + (m_{10} + m_{14}) B_4 + (m_2 + m_{10}) B_5 + (m_2 + m_{14}) B_6 \}
\]

Sherwood number:

The dimensionless Sherwood number is given by

\[
Sh = -\left( \frac{dC}{dy} \right)_{y=0} = m_2 D_1
\]

IV. RESULTS AND DISCUSSION

From figure (1), we observe that the velocity distribution \(u\) is drawn against \(y\) for different values of magnetic parameter \(M\) for visco-elastic parameter \(\lambda = 0.1\) and Prandtl number \(Pr = 0.71\) (air). We notice that the velocity distribution \(u\) decreases with the increase in \(M\). From figure (2) velocity distribution \(u\) for visco-elastic parameter \(\lambda = 0.1\) is drawn against \(y\) for different values of Grashof number \(Gr\). We notice that the \(u\) increases as \(Gr\) increases. From figure (3), velocity distribution \(u\) is drawn against \(y\) for different values of visco-elastic parameter \(\lambda\). Here velocity distribution \(u\) increases with the increase of \(\lambda\). Figures (4) and (5) represents the distribution \(u\) is drawn against \(y\) for different values of Schmidt number \(Sc\) and Eckert number \(Ec\). We observe that velocity distribution \(u\) is decrease with increase in \(Sc\) and \(Ec\). Figures (6) and (7) represents the distribution \(u\) is drawn against \(y\) for different values of porous permeability parameter \(K\) and Chemical reaction parameter \(Kr\). We observe that velocity distribution \(u\) is increase with increase in \(K\), where as decrease with increase \(Kr\) Figures (8) - (14) is drawn for Temperature distribution \(\theta\) against \(y\) for different values of Eckert number \(Ec\), Grashof number \(Gr\). Porous permeability parameter \(K\), Chemical reaction parameter \(Kr\). Magnetic parameter \(M\), heat source parameter \(\phi\) and Schmidt number \(Sc\). Here we observed that the Temperature distribution \(\theta\) increases with Eckert number \(Ec\) and heat source parameter \(\phi\) increases, where as the reverse effect noticed with increase in \(Gr, K, Kr, M\) and \(Sc\). From Figures (15) and (16) we observe that an increase in \(Kr\) and \(Sc\) leads to decrease in the Concentration profiles \(C\). Figure (17) is drawn for Skin-friction
(τ) at λ = 0.1 is drawn against magnetic parameter (M) from this figure we observe that τ decreases with the increase of Kr for Pr = 0.71. Figure (18) shows that Nusselt number (Nu) versus Prandtl number (Pr) for different values of Grashof number (Gr). We observe that Nusselt number (Nu) at λ = 0.1 increases with the increase of Gr.

APPENDIX

m₁ = −\sqrt{\frac{K_{r}S_{c}}{\beta_1}} \quad m₂ = −\sqrt{\phi_{1}} \quad m₃ = −\sqrt{N_1} \quad m₄ = −\sqrt{\beta_2} \quad N₂ = (1 + \lambda n) \beta₂ = −(\phi + n) Pr

B₅ = \frac{2Pr \cdot m₅ \cdot m₆ \cdot A₅}{(m₅ + m₆)^2 - Pr \phi} \quad B₆ = \frac{2Pr \cdot m₆ \cdot m₇ \cdot A₆}{(m₆ + m₇)^2 - Pr \phi} \quad B₇ = −\left( B₁ + B₂ + B₃ + B₄ + B₅ + B₆ \right)

V. CONCLUSION

The objective of the present study, we discuss the heat and mass transfer on MHD unsteady visco-elastic second order Rivlin-Erickson fluid past an impulsively started infinite vertical plate in the presence of a foreign mass and constant mass flux on taking into account of viscous dissipative heat at the plate under the influence of a uniform transverse magnetic field in the presence of chemical reaction. The resulting partial differential equations are transformed into a set of ordinary differential equation using normalisation and solved in closed-form. Numerical evaluations of the closed- form results are performed and graphical results are obtained to illustrate the details of the flow and heat and mass transfer characteristics and their dependence on some physical parameter. It is observed that the velocity profile is increasing with increasing slip parameter, Grashof number, viscoelastic parameter and permeability of porous medium. Also, velocity reducing with decreasing magnetic parameter, Schmidt number, Eckert number and chemical reaction parameter. The fluid temperature is reduced by increases in the values of the Grashof number, porous permeability, chemical reaction, magnetic parameter and Schmidt number, but the temperature increasing with increasing values Eckert number, heat source parameter. Concentration is reducing with increase in Schmidt number and chemical reaction parameter. In addition, it is found that skin friction coefficient decreases with chemical reaction parameter. However, the Nusselt number increases with an increase in Grashof number.
