Keywords: Macroeconomics, Microeconomics, Cusack's Universe, Wave equation.

ABSTRACT

In the same way that there are fundamental forces in Nature (Gravity, Nuclear, and Electromagnetic) the same appear in Economics. In the same way that these Macro forces (Cosmological) can be reduced to Quantum Forces (the Wave Equation). Economics too has the same equation. This paper provides the calculations that lead to the Fundamental Solution to Economics.

THE INTEREST FORMULA

If the Interest Formula is (Figure 1):

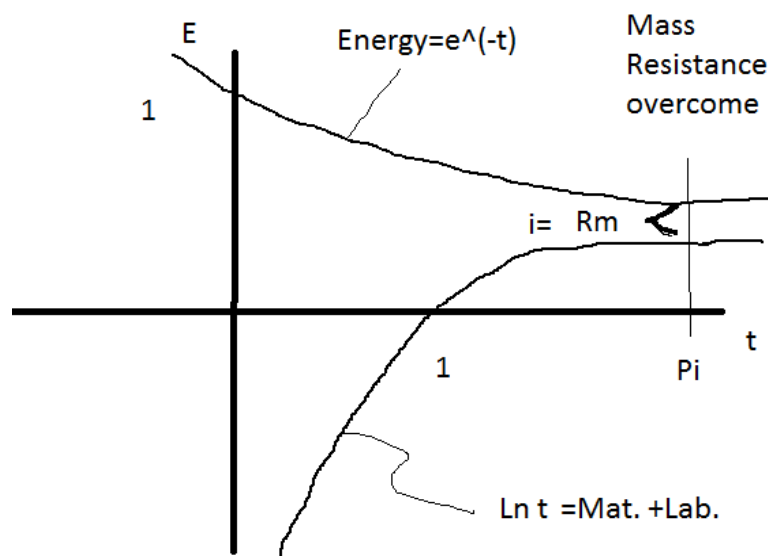

Figure 1. Illustration 1, energy vs. time in physics and economics.

$$(1+i)^N$$

Then,

$$(1+Rm)^{Pi}$$

Rm = Resistance to Mass formation; or the cost of money i.

Pi = time t.

$$E = \text{Energy} = \text{GDP}$$

So, we take the sum of Inputs Interest and Material and Labour which sum to the GDP or Energy:

$$e^{-(t)} = R_m + \text{Ln } E$$

$$\text{Money Supply} = \text{M.S.} = 7 = 10/\text{sq. rt } 2$$

$$7.07 = (t-E) + \text{Ln } E$$

$$8.07E = \text{Ln } E$$

$$E = 0.868$$

Quantum Mechanics, Position Equals Velocity

Let,

$$L = v \text{ (L = Position; } v = \text{Velocity from Quantum Mechanics)}^{[1]}$$

$$\text{Integral } L = \text{Integral } v$$

$$\text{Money Supply} = \text{M.S} = L$$

$$\text{Integral } L = L$$

$$\text{M.S.} = L = v$$

The Super-force and the Grand Unified Theory ^[2]

$$\text{M.S.} = \sin \theta = F = Ma = P = Mv = \text{Super-force}$$

$$F = 8/3 = 2.667$$

$$\text{Money Supply/ Individual's Money} = \text{M.S./I.M} = \sin \theta * M$$

$$8.3 = \sin \theta M^2$$

$$8/3 = 0.8415 M^2$$

$$M = 3.16 \sim \pi = t$$

$$\text{I.M.} = \pi^2 = 1.7802$$

$$\pi^2/11521 = 1.7802/115 = 1.548 \sim 1.5$$

$$\text{Mass Gap} = 1/G \text{ where } G = 2/3 = \text{Gravitational Constant.}$$

Since it takes money to make money, the more money one accumulates, the more one has to invest and make more money. It is the same with Mass or matter. Gravity works the same for money as it does for matter.

$$F = 8/3 = Ma = Mv$$

$$a = v = 0.8415$$

$$M = F/a = 8/3/0.8415 = 3.1689 = \pi = t$$

$$M = t$$

$$dM/dt = dt/dt = 1$$

$$\text{Integral } dM/dt = M = 1$$

$$E = 1/t = 1/1 = 1 = \text{World GDP}$$

Golden Mean Energy Parabola

$$t^2 - t - 1 = E = e^{-(t)}$$

$$2 \text{Ln } t - \text{Ln } t - 0 = -t$$

$$\text{Ln } t = -t$$

$$1/t = 1$$

$$t = 1$$

$$1/2 * E * t * s = 1/2 (0.868)(1)(4/3) = 1/\text{sq. rt } 3$$

Schrodiner's Wave Equation

The Wave Equation governs atoms and individuals in an economy.

$$U + iV = 1 + (1)(0.618) = 1.618$$

$$1.618 = 1 / \sqrt{2 \cdot \pi} \cdot e^k$$

$$k = 14.001$$

Now,

$$(1 + e^t) = 1.73 = \text{eigen vector.}$$

$$e^t = 0.73$$

$$\ln(0.15t) = \ln 0.73$$

$$15t = 3.14$$

$$t = 2.098$$

$$= 2.15$$

$$\ln(t) \cdot \ln 2.15 = 3.069 = c$$

$$\ln t = t$$

$$1/t = t$$

$$E = t$$

CONCLUSION

The Economy is always seeking to find this Optimum condition. When Individuals seek to save 15% or 1/7 of their Income which is used for Investment, the Economy is functioning "on all cylinders". It creates an economic situation where the velocity of money is equal to the supply.
