**ABSTRACT:** Butterflies are important components of biodiversity and play an important role in the food chain of a forest ecosystem. An attempt was being made to enumerate the butterfly nectar food plants in Glenmorgan, Nilgiris District, Tamil Nadu. The present study has been aimed to explore the floral attributes of nectar feeding butterflies in relation to relative abundance. A total of 65 species of butterflies belonging to 5 families were recorded as flower visitor and nectar feeding on 84 species of plants belong to 69 genera and 30 families. The highest number of butterflies belonging to the family Nymphalidae 26 species, Pieridae 14 species, Lycaenidae 13 species, Hesperiidae and Papilionidae with 6 species. Plant visitors of different butterfly species varied considerably; while some were highly seasonal, others had staggered for flowering and vegetative habitats.

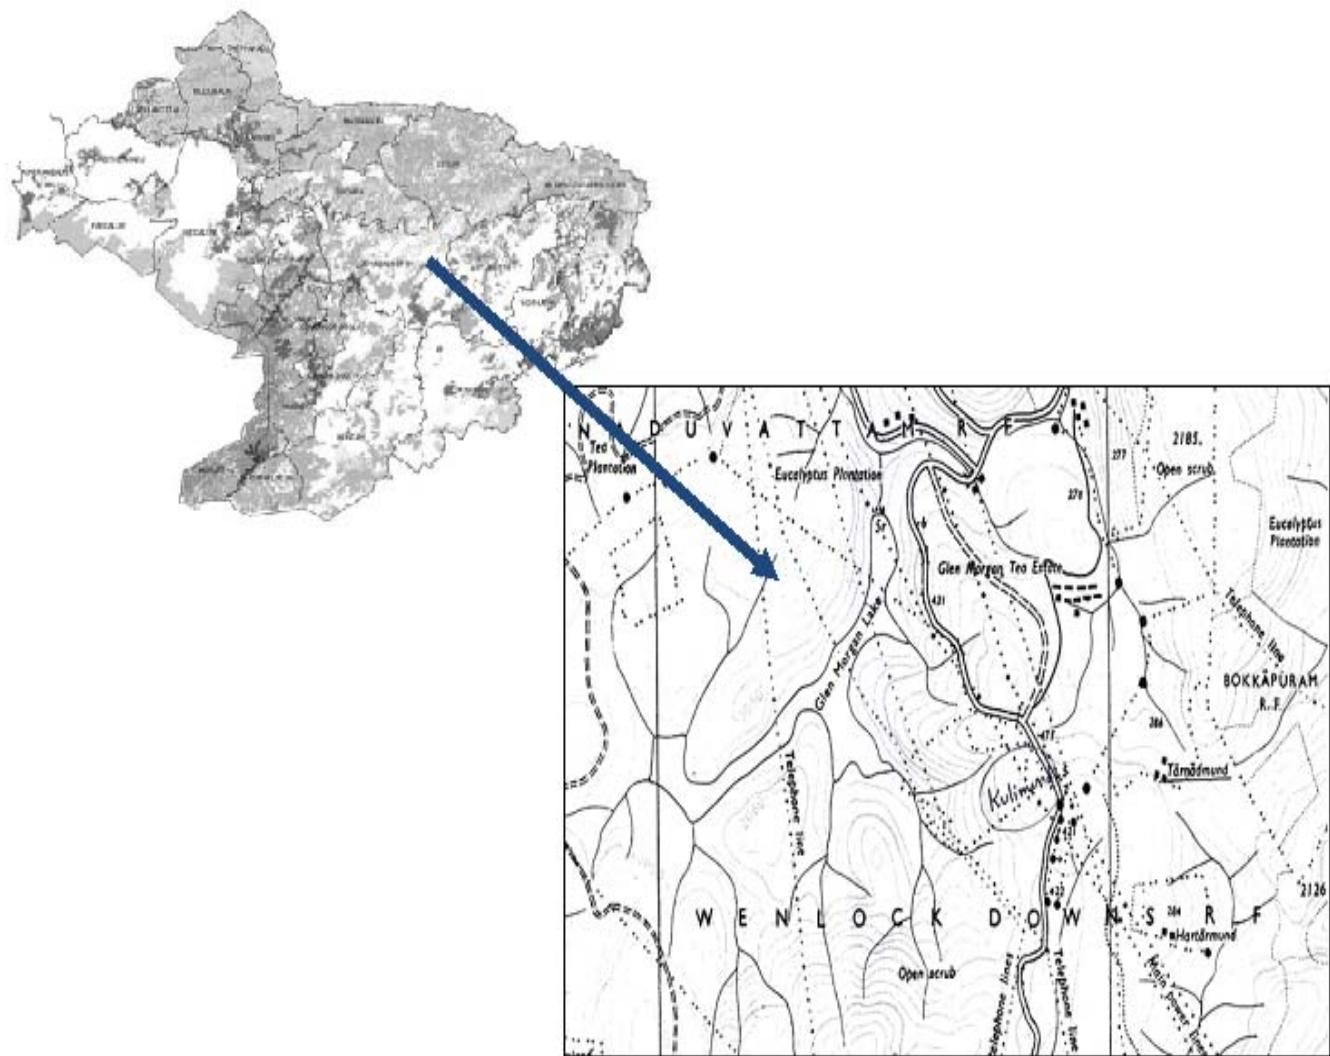

**Keywords:** Butterfly, nectar food plants, abundance, Glenmorgan, The Nilgiris

### INTRODUCTION

The Nilgiris is situated in the Western Ghats of India, one of the eight hottest hot spots of the world is known for its rich biodiversity. Interaction of living organisms with environment has led to an increase in biodiversity [1]. Butterflies are one of the most plant dependent group in insects [2]. About 300 species of butterflies are found in the Nilgiris [3]. Butterflies are important natural resources as they help in pollination, natural propagation and they feed on specific host plant foliage, nectar and pollen as their food. There is an association between butterflies and plants and their lives [4]. Flowering plants of 2,100 species are endemic to peninsular India, among this 818 are found in the Nilgiris and adjoining areas. The relationship between butterflies and plants is very specific and attracted by flower colours like red, yellow and blue, having diurnal anthesis. Thus butterflies reflect overall plant diversity, mainly herbs and shrubs. Butterflies are good indicators of environmental changes in the ambient features of any ecosystem. Seasonal variation probably reflects the phenophases of their host plant [5]. Hence the present investigation has been carried out to explore the nectar food plants and relative abundance of butterflies in Glenmorgan, the Nilgiris, Tamil Nadu.

### MATERIALS AND METHODS

**Study area:** The study on butterfly nectar plants was carried out in Glenmorgan, the Nilgiris, is situated between 11°29'N and 76°32'E. It has an elevation of about 2057msl. The study was extensively carried out from July 2013 to March 2015. Observations were made between 08:00h to 15:00h. Butterfly species were identified directly by sighting with the help of standard identification keys and field guides. Collection was restricted and photographic documentation has done. All scientific names followed by Varshney, 1993 and Kunte, 2000 [6, 7]. Common names after Wynter-Blyth, 1957 [8]. Plant materials were collected and identified with the floras, taxonomic revisions and monographs by using identification keys [9, 10]. Habit and associated species distribution pattern were also noted.

**Fig 1. Map showing study area- Glenmorgan, the Nilgiris**

## RESULTS AND DISCUSSION

A list of total 65 species of butterflies belonging to 5 families were recorded of which Nymphalidae 26 species, Pieridae 14 species, Lycaenidae 13 species, Hesperiidae and Papilionidae with 6 species each (Table 1). Species belonging to the family Nymphalidae were the most dominant (40.00%) followed by Pieridae (21.53%), Lycaenidae (20.00%), Papilionidae and Hesperiidae with (9.23%) each. The family Hesperiidae is known as skippers and an indicator of richness and uniqueness of the habitat. The relative abundance of butterflies family are presented in (Table 2). Totally 84 species of plants belonging to 69 genera and 30 families were identified (Table 3). The habit of plants were made for the life forms and found 48 herbs, 24 shrubs, 5 trees, 5 climbers, 1 straggler and 1 small tree (Fig 2).

Dominant families of plants such as Asteraceae with 20 species, Lamiaceae 8 species, Fabaceae 6 species, Solanaceae 6 species, Malvaceae and Rosaceae with 4 species each (Fig 3). Most of the butterfly feeds on *Lantana camara* flower and leaves. It has flowering period throughout the year [11]. *Udara akasa* were feeding on *Persicaria chinensis*. *Argynnis hybrida* visited on grassland area. Lycaenidae family species are feed on grass such as *Oplismenus undulatifolius* and *Poa annua*. *Colotis danae* and *Belenois aurota* were found to be active in mud puddling. *Melanitis leda*, *Mycalesis perseus*, *Junonia iphita* and *Ypthima huebneri* were observed in dry leaves on Sholas under stories. *Vindula erota* were observed on avian droppings.

2.	Pieridae	14	21.53
3.	Lycaenidae	13	20
4.	Nymphalidae	26	40
5.	Hesperiidae	6	9.23
<b>Total</b>		65	100

The flora of the Nilgiris has shown a relationship with that of the Eastern Himalayas. In this region forests are evergreen composed of tropical and subtropical vegetation [12] has been found that the abundance of butterflies is highly related to the availability of food plants. Flower colour such as white and yellow served as dominant nectar visitors. George Mathew [13] has been reported about 1,500 species of butterflies has been reported from India, of which Peninsular India hosts 350, and the Western Ghats 330 species. Cyril and Sabarinathan [14] listed 85 butterfly species from Thengumarahada in the Nilgiris. Gunathilagaraj [15] reported 174 species of butterflies from Palani Hills.

## CONCLUSION

Butterfly fauna is rich in the Nilgiris. They are being used as indicators of environmental variation. The present study observed that butterflies dependent on plants for nectar. An attempt has been made to enumerate the butterfly nectar food plants revealed on the diversity and quite conscious on the importance of protection of their biological resource.
